Aufgabe 2 - Geschichten vom ...

Lösungsidee:

Zuerst das Replacements file zeile für zeile lesen und jede zeile mit split auf die beiden wörter aufteilen und diese in einem record repl mit old- und newword speichern.

Danach zeilenweise über das inputfile iterieren und die funktion StringReplace für jedes repl auf jeder zeile anwenden und die veränderte zeile ins outputfile schreiben.

Ich denke das funktion wie SplitString und ReplaceString wahrscheinlich nicht so gern gesehen sind, aber meiner Meinung nach solange es nicht in der Angabe steht sollte es mir erlaubt sein alle Möglichkeiten der Sprache Pascal zu nutzen. (gleiche gilt für dynamic arrays)

Zeitaufwand: 45min

Code:

```
program StoryGen;
uses SysUtils, StrUtils;
type
  Repl = record
    OldWord: string;
   NewWord: string;
  end;
procedure CheckIfFileExists(fileName: string);
  if not FileExists(fileName) then
   WriteLn('Error: file does not exist - ', fileName);
   writeln;
   Halt;
  end;
end;
procedure CheckFilenamesIdentical(file1, file2: string);
begin
  if (file1 = file2) then
  begin
    WriteLn('Error: file can not be the same - ', file1);
   writeln;
   Halt;
  end;
end;
```

```
function GetFilename(paramInt: Integer; msg: string): string;
var
  fileName: string;
begin
  if ParamCount > (paramInt - 1) then
    fileName := ParamStr(paramInt)
  else begin
    write(msg, ' > ');
    ReadLn(fileName);
  GetFilename := fileName;
end;
var
  repls: array of Repl;
procedure readRepls(fileName: string);
  replFile: TEXT;
  line: string;
  words: array of AnsiString;
begin
  assign(replFile, fileName);
  reset(replFile);
  while not eof(replFile) do
  begin
    readln(replFile, line);
    words := SplitString(line, ' ');
    if (not (High(words) = 1)) then
    begin
      WriteLn('Error: incorrect format of replacements file');
      writeln;
      Halt;
    end;
    SetLength(repls, Length(repls) + 1);
    repls[Length(repls) - 1].OldWord := words[0];
    repls[Length(repls) - 1].NewWord := words[1];
  end;
  close(replFile);
end;
```

```
procedure openFiles(var inFile, outFile: TEXT; inFileName, outFileName:
string);
begin
  Assign(inFile, inFileName);
  Reset(inFile);
  Assign(outFile, outFileName);
  Rewrite(outFile);
end;
procedure closeFiles(var inFile, outFile: TEXT);
begin
 Close(inFile);
  Close(outFile);
end;
procedure replaceWords(var line: string);
var
  i: integer;
begin
  for i := 0 to Length(repls) - 1 do
    line := StringReplace(line, repls[i].OldWord, repls[i].NewWord,
[rfReplaceAll, rfIgnoreCase]);
end;
procedure runReplacements(inFileName, outFileName: string);
var
  line: string;
  inFile, outFile: TEXT;
begin
  openFiles(inFile, outFile, inFileName, outFileName);
  while(not Eof(inFile)) do
  begin
    ReadLn(inFile, line);
    replaceWords(line);
   writeln(outFile, line);
  end;
  closeFiles(inFile, outFile);
end;
var
  replsFileName, inFileName, outFileName: string;
begin
  replsFileName := GetFilename(1, 'Enter fileName with the replacements');
  CheckIfFileExists(replsFileName);
  inFileName := GetFilename(2, 'enter text infilename');
```

```
CheckIfFileExists(inFileName);
CheckFilenamesIdentical(inFileName, replsFileName);

outFileName := GetFilename(3, 'enter text outfilename');
CheckFilenamesIdentical(outFileName, replsFileName);
CheckFilenamesIdentical(outFileName, inFileName);
readRepls(replsFileName);
runReplacements(inFileName, outFileName);
end.
```
